If there is one company that understands the needs of its customers, it's Hard

Dollar, Tempe, Ariz. Maybe that's because the company's management team has 200 years of collective experience in infrastructure construction, as well as the ability to design systems based on customers' needs.

One of the most important needs among construction professionals is the ability to integrate such systems as estimating and construction management software. Hard Dollar has been able to meet this demand, especially with the release of its BID\*BUILD software, which offers bidding, estimating, and construction management in one package. Ease of use coupled with feature-rich systems is also a high priority for contractors, which is why Hard Dollar has formed a strategic partnership with Microsoft to implement .Net technology into the BID\*BUILD system. Now customers can quickly access information, as well as customize it to their particular needs in a flexible software environment.

Hard Dollar has secured such customers as Blois Construction, Oxnard, Calif., and Civil Constructors Inc., Franklin, Tenn., both of whom say that the BID\*BUILD system has been one of the few software packages that allows them to bid and manage projects all at the same time. Hard Dollar's revenues also echo this success. Although the company is private, it boasts increases of more than 28%.
