

Hard Dollar Corporation

According to Hard Dollar, its Project Lifecycle Management Enterprise software — currently in beta testing with an expected public release this summer — offers project-driven enterprise companies a way to manage critical information across multiple projects. Users can analyze how resources interact across multiple projects and how they affect the business at any stage throughout the project lifecycle. Changes made to existing projects occur in real time without refreshing the current view. Additionally, field personnel can input information via a wireless Internet connection or handheld device. Individual users can define their own dashboards displaying information important to their job function, including single or cross-project reports, graphs, and gauges.

Hitachi Software Global Technology

CADGeoWeave software from Hitachi Software Global Technology enables AutoCAD and Autodesk Map users to access and update GIS data stored in ESRI, Intergraph, MapInfo, Smallworld, and Oracle file formats. The program does not require any upgrades to existing GIS or CAD software. Engineers can use their CAD environment to customize, manage, and publish designs, which then can be uploaded to the firm's GIS system. Additionally, CADGeoWeave lets users access GIS data across the Internet and integrate it with the CAD drawings.
